Proliminary amendmentfilled 9/9/2003

AMENDMENTS TO THE SPECIFICATION

OF THE INVENTION":

• Please add the following new paragraph on page 2, line 1 before the heading "FIELD \(\mathcal{L} \)

-- CROSS REFERENCE TO RELATED APPLICATIONS

This application is a divisional of co-pending U.S. Patent Application Serial No. now US Patent 6, 639,054, 09/755,630 filed January 5, 2001, which claims the benefit of U.S. Provisional Application Serial No. 60/174,669 filed on January 6, 2000.--

- Please delete the paragraph beginning at page 74, line 13, and replace it with the following substitute paragraph:
- --Site specific mutations were introduced into patatin by first incorporating part of the afactor signal sequence (Pichia expression manual, Invitrogen, Carlsbad, CA) to the patatin gene PCR. using **Primers** used for the PCR were GGAGCTCGAGAAAAGAGAGGCTGAAGCTCAGTTGGGAGAAATGGTGACTGTTCT (SEQ ID NO: 3) (XhoI site in italics) and GGTCTAGAG GAATTCTCATTAATAAGAAG (SEQ ID NO: 4) (EcoRI site in italics). The primers contained restriction sites to facilitate cloning into Pichia pastoris yeast secretion vector pPIC9 (GenBank accession number Z46233; Invitrogen, Carlsbad, CA). Typical PCR conditions are 25 cycles 94 °C denaturation for 1 minute, 45 °C annealing for one minute and 72 °C extension for 2 minutes; plus one cycle 72 °C extension for 10 minutes. A 50 mL reaction contained 30 pmol of each primer and 1 mg of template DNA; and 1 X PCR buffer with MgCl₂, 200 mM dGTP, 200 mM dATP, 200 mM dTTP, 200 mM dCTP, 2.5 units of Pwo DNA polymerase. PCR reactions are performed in RoboCycler Gradient 96 Temperature Cycler (Stratagene, La Jolla, CA).--
